

OUR CAPABILITIES

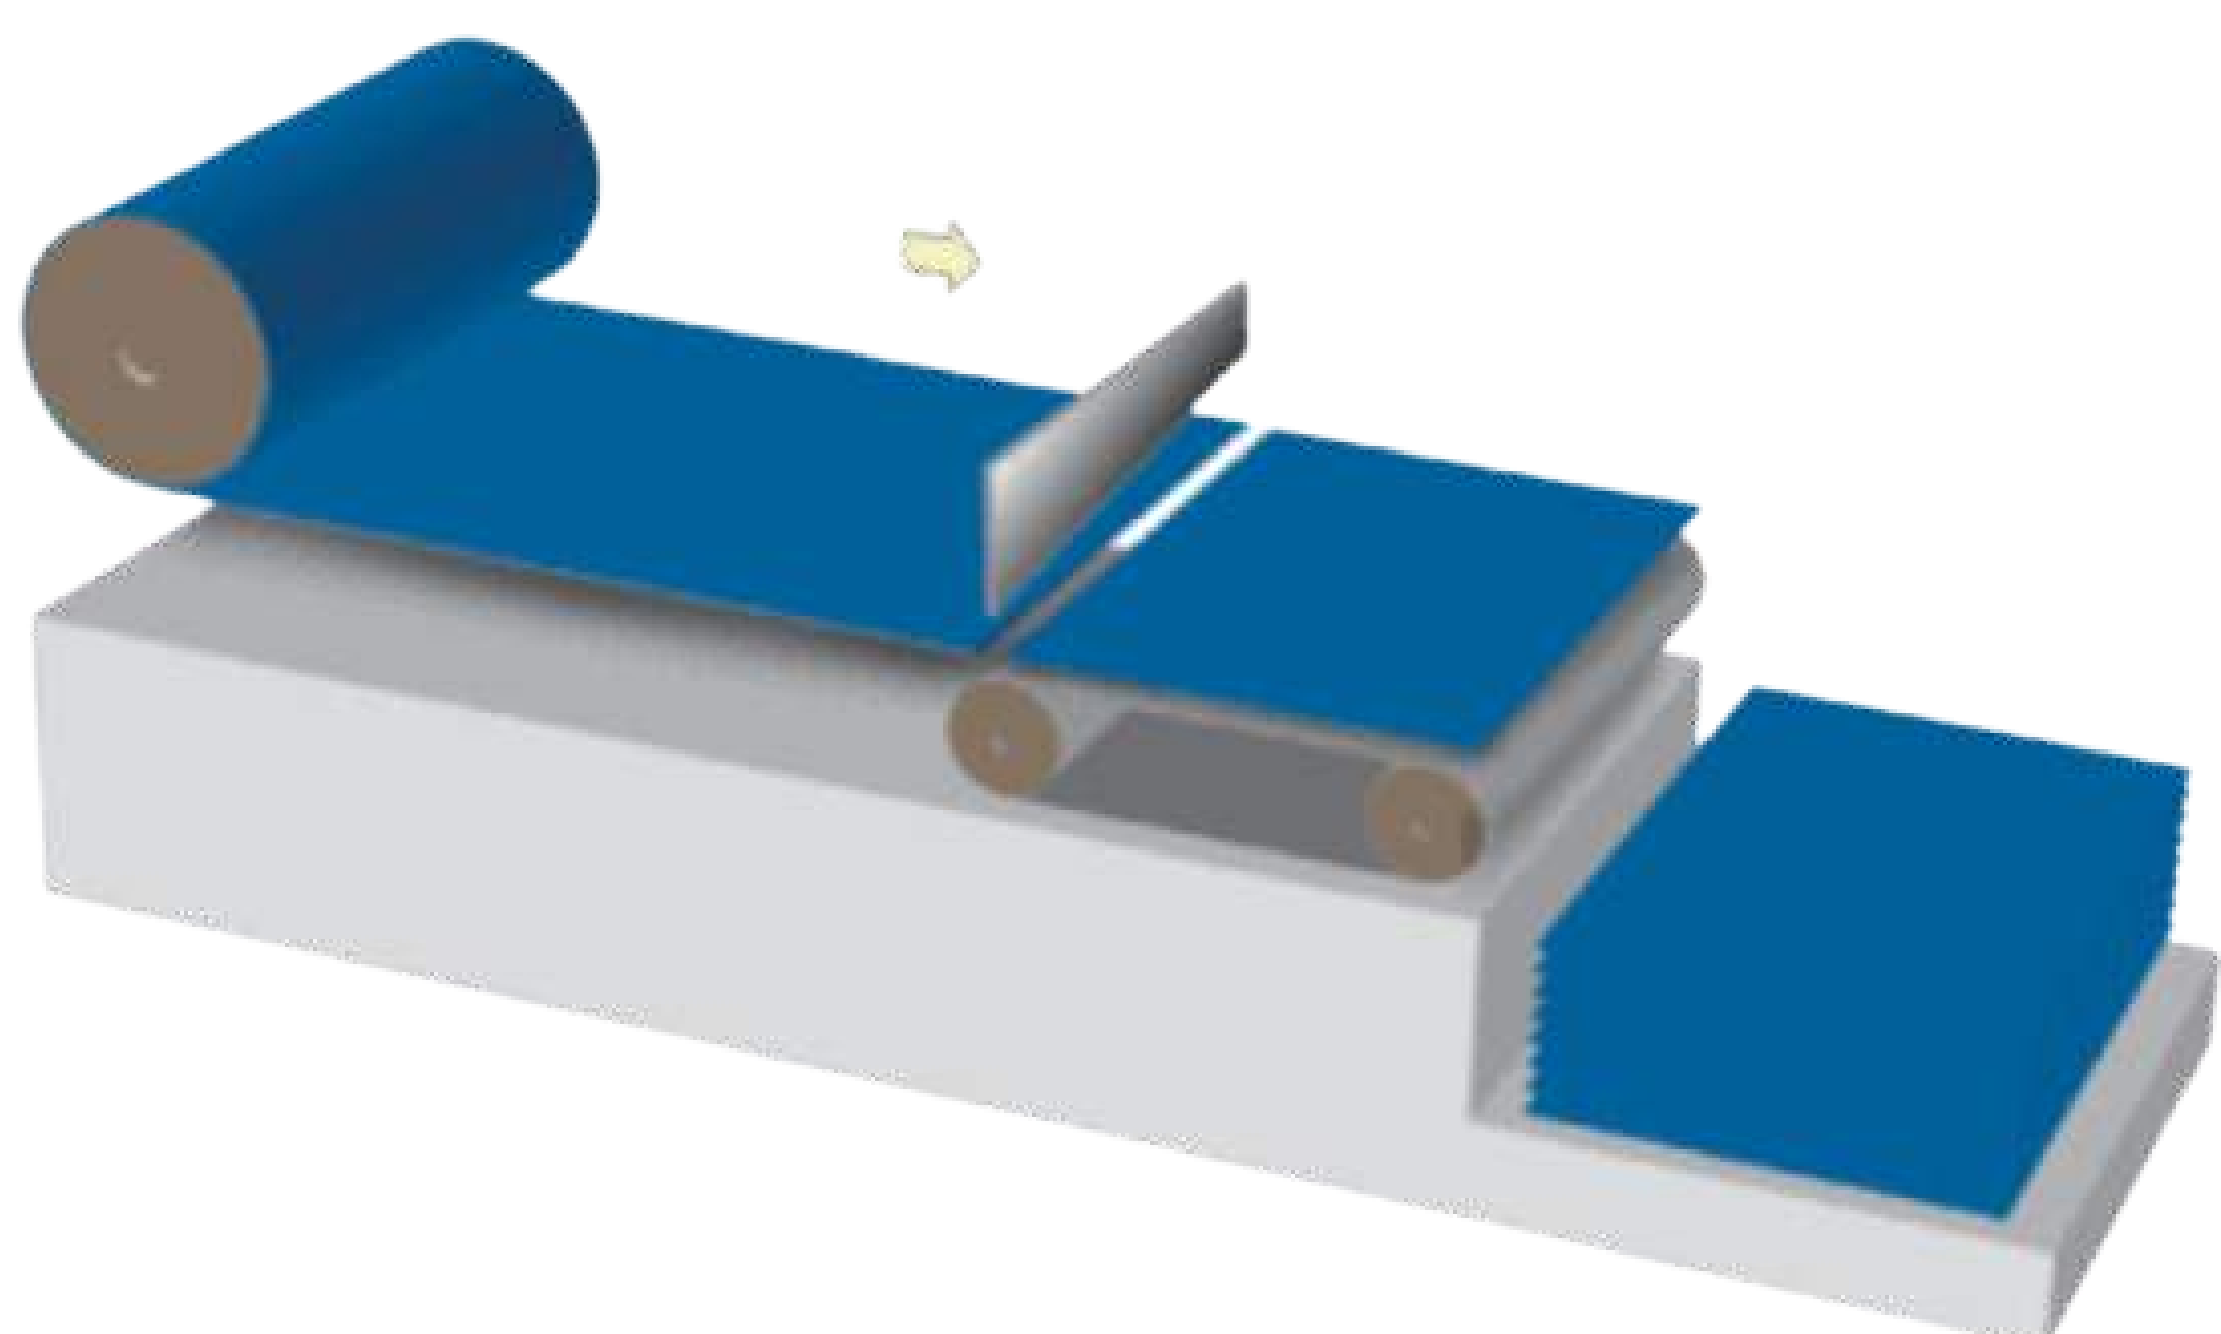

GUILLOTINING FOR LAMINATING AND SHEETING TO CUSTOM SIZES

The guillotine is a process that is roll-fed and can conduct lamination and sheeting in one step. It is also commonly used to apply different adhesive types to non-adhesive substrates and sheet to squares and rectangles, to aid the final application of the product.

Additionally, we can laminate zones of material, in specific locations across the width and can apply various application aids, such as overlapped carrier liners, to already adhesive materials while sheeting. This process is most commonly used for the manufacture of incision films where handlebars can be added, support films removed and the film is guillotined into the final dressing sheet size before being rolled and packed.

- MAXIMUM SHEET WIDTH: 1100mm
- MAXIMUM SHEET LENGTH: 1600mm
- WITH IN-LINE LAMINATION FACILITY
